Chem. 277:8004-8011(2002).

1- FUNCTION: Transcription factor that binds to the interleukin-6

1- FUNCTION: Transcription factor that binds to the interleukin-6

1- FUNCTION: Transcription factor that binds to the promoters of various (L.6) -reapponaive elements identified in the promoters of various acute-phase protein genes.

1- FATHWAY: Involved in the gp130-mediated signaling pathway.

1- SUBUNIT: Forms a homodimer or a heterodimer with a related family member (at least STAYI). Interacts with NCOA1.

1- SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation.

1- ALTERNATIVE PRODUCTS:

Event-Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolda-P40763-2; Sequence-VSP 010474;
Isolda-P40763-2; Sequence-VSP 010474;
TISSUE SPECIFICITY: Heart, brain, placenta, lung, liver, skeletal muscle, kidney and pancreas.
PIN: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, IIF, CSF-1, EGF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity.
SIMILARITY: Belongs to the transcriptional activity.
SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PubMed=11773079; DOI=10.1074/jbc.M111486200;

                                                       Nature 394:145-151(1998).

-! FUNCTION: Transcription factor that binds to the interleukin-6 (IL-6) responsive elements identified in the promoters of various acute-phase protein genes. STAT3B interacts with the N-terminal part of JUN to activate such promoters in a cooperative way.
-! PATHWAY: Involved in the gp130-mediated signaling pathway.
-! SUBUNIT: Forms a homodimer or a heterodimer with a related family member (at least STAT1). Interacts with NCOA1 (By similarity).
-! SUBCELLUIAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation.
                                                                                                                                                                                                                                                                                                                                                                                                       Name=bel-701;
ISOUE-842227-3; Sequence=VSP 010475;
ISOUE-842227-3; Sequence=VSP 010475;
TISSUE SPECIFICITY: STAT3A is geen in the liver, although in a much kidney. STAT3B is also detected in the liver, although in a much less abundant manner.

PTW: Tyrosine phosphorylated in response to IL-6, IL-11, CNTF, ILF, GSF-1, EGF, PDGF, IFN-alpha and OSM. Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity (By similarity). SIMILARITY: Belongs to the transcription factor STAT family.

Biol. Chem. 270:29998-30006(1995).

-! FUNCTION: Transcription factor that binds to the interleukin-6

(IL-6)-responsive elements identified in the promoters of various
acute-phase protein genes.

-! PATHWAY: Involved in the gp130-mediated signaling pathway.
-! PATHWAY: Forms a homodimer or a heterodimmer with a related family member (at least STATI). Interacts with NCOA1 (By similarity).
-! SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus
                                                                                                                                                                                                                                                                                                                                                                                                                     1 VQDLEQKMKVVENLQDDFDFNYKTLKSQGDMQDLNGNNQSVTRQKMQQLEQMLTALDQMR

Seyfert H.M., Wheeler T.T., Moolenaar A., Pitra C.;
Submitted (JAN-2004) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Transcription factor that binds to the interleukin-6 (IL-6)-responsive elements identified in the promoters of various acute-phase protein genes (By similarity).
-!- PATHWAY: Involved in the gp130-mediated signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SWART; SM00252; SH2; 1.
PROSITE; PS50001; SH2; 1.
Activator; DNA-binding; Nuclear protein; Phosphorylation; SH2 domain;
           PTM: Tyrosine phosphorylated in response to fir-6, IL-11, CNTF, LIF, CSF-1, EGF, PDGF, IFN-alpha and OSM Serine phosphorylation is important for the formation of stable DNA-binding STAT3 homodimers and maximal transcriptional activity (By similarity). SIMILARITY: Belongs to the transcription factor STAT family. SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
-!- SUBUNIT: Forms a homodimer or a heterodimer with a related family member (at least STAT1). Interacts with NCOA1 (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic; translocated into the nucleus in response to phosphorylation (By similarity).
-!- SIMILARITY: Belongs to the transcription factor STAT family.
-!- SIMILARITY: Contains 1 SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           (By similarity).

The present sequence is mouse Stat3 protein fragment containing 249-377 amino acids of Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A

The present sequence is mouse Stat3 protein fragment containing 155-377 amino acids of Stat3 protein. The invention relates to methods for identifying interacting regions of transcription factors and methods for tidentifying agents which modulates the interaction between a stat protein such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain

The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of dysproliferative diseases and also for treating cancer and psoriasis. A Stat protein comprises the N-terminal domain, coiled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                       9
                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      150. .166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ដ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is mouse Stat3 protein fragment containing 107-377 amino acids of Stat3 protein. This Stat3 fragment showed strong binding to c-Jun protein in the cell extract. The invention relates to methods for identifying interacting regions of transcription factors and methods for identifying agents which modulates the interaction between a transcription factor such as c-Jun and a Stat protein such as Stat-1 and Stat-3, useful for modulating gene transcription e.g., cellular transformation. These identifying agents are used in the treatment of typroliferative diseases and also for treating cancer and psoriaeis. A Stat protein comprises the N-terminal domain, colled-coil domain, DNA binding domain, linker domain, SH2 domain and transactivation domain
                                                                                                                                                                                                                                                                                                                                                                                Mouse; Stat3 protein; transcription factor; c-Jun; gene transcription; cellular transformation; dysproliferative disease; cancer; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing

tissue ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, tranuma, vascular occlusion, prenatal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, critogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, crychematosus, multiple sclerosis, insulin dependent diabetes mellitus, crychematosus, multiple sclerosis, insulin dependent diabetes mellitus, crychemia, autoimmune disease, primary biliary cirrhosis, pernicious mixed connective tissue disease, primary biliary cirrhosis, pernicious cracanicamune thyroiditis, idiopathic Addison's disease, vicuamatoid arthritis, discoid lupus, ulcerative colitis and dense deposit disease. The method is useful in preventing or treating cracinity, bullous pemphigoid, discoid lupus, ulcerative colitis and cardinomas e.g., bladder carcinoma, colon carcinoma, chomes earcomas and carcinoma, degenerative disorders, growth deficiency, hypoproliferative disorders, physical trauma, lesions and wounds. The method is also used in gene therapy. The present sequence is human creating statibles are desposed to the present sequence is human creating cracinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample comprising the expression profile of a gene group in the sample comprising selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB19202 to AB19912), encoding the protein sequences in ABB5702 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression corprising produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription of 3 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemia, condition or disorder which is the result of stroke, ischaemia, coronary atheroselerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, crissue ischaemia in the lower extremities, infarction, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, cpilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, nitrogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy critical meliorating a symptom of an autoimmune isease such as systemic lupus erythematosus, multiple sclerosis, insulin dependent diabetes mellitus, claminer syndrome, soleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, infarting vicinchosis, pernicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo, anaemia, autoimmune thyroiditis, disopathic Addison's disease, vitiligo, disease, rheumatoid arthritis, cirrhosis, pemphigus vulgaris, and disease, rheumatoid arthritis, cirrhosis, pemphigus vulgaris, and charca charcair disease when method is useful in preventing or treating and charca charcair disease when method is useful in preventing or treating
                                                                                                                                                                                                                                                                    Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dense deposit disease. The method is useful in preventing or treating specific proliferative and oncogenic disease which includes sarcomas and

14-MAR-2002.

Modulating anglogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3.

Disclosure; Page 83-85; 94pp; English.

coclusion, prenatal or postnatal oxygen deprivation, transma, vascular cocclusion, prenatal or postnatal oxygen deprivation, suffocation, shock, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, epilepsy, emphysema, adult respiratory distress syndrome, cardiac arrest, nitrogen necrosis, proliferative angiopathy e.g. diabetic microangiopathy with neovascularisation. Suppressing an immune response is useful for ameliorating a symptom of an autoimmune disease such as systemic lupus cryptematosus, multiple sclerosis, innulin dependent diabetes mellitus, Sjogram's syndrome, scleroderma, polymyositis, chronic active hepatitis, mixed connective tissue disease, primary biliary cirrhosis, pernicious anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo, dispathic thrombocytopenia purpura, Grave's disease, Goodpasture's dispathic thrombocytopenia purpura, Grave's disease, Goodpasture's dispathic thrombocytopenia purpura, Grave's disease, colitis and dense deposit disease. The method is useful in preventing or treating specific proliferative and oncogenic disease which includes sarcomas and carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, ilbrosarcoma, liposarcoma, degenerative disorders, growth deficiency, hypoproliferative disorders, physical trauma, lesions and wounds. The method is also used in gene therapy. The present sequence is human The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, assemble method is also used in gene therapy. The poprotein related to angiogenesis regulation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A fragment encoding the human Stat91 protein was used to screen a murine thymus and spleen cDNA for homologous proteins. A highly homologous gene (given in AAQ99338) was isolated that encoded a 91 kDa protein (AAR72080) (Stat1) that was responsive to interferon- gamma. Using a fragment of the mouse gene as probe, 2 additional members of the 113-91 family of receptor recognition factor proteins were isolated. The 2 genes (AAQ89339 -40) were cloned in plasmids 13sfl and 19sf6 and encoded proteins termed Stat4 (AAR72081) and Stat3 (AAR72082), respectively. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                     Signal transducer and activator of transcription; STAT; 19sf6; Stat3; receptor recognition factor; transcription factor; cellular debilitation; derangement; dysfunction; interferon-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Receptor recognition factor implicated in transcriptional stimulation of genes - useful in drug screening assays and/or for treating cellular debilitations, derangements and/or dysfunctions, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a mouse acute phase response factor (APRF), a transcription factor related to signal transmission of interleukin-6 (IL-6). The protein is encoded by a cDNA, isolated from a mouse liver cDNA library using a polymerse chain reaction product (amplified using primers derived from an IL-6-treated mouse liver peptide) as a probe. APRF-inhibitors, e.g. antibodies, antisense oligonucleotides or ribozymes, may be used to treat diseases induced by IL-6, e.g. inflammatory disease, leukemia, cancer, osteoclasia, pulmonary
New acute phase response factor - for developing inhibitory agents for treating diseases induced by cytokine(s) such as IL-6, e.g. inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse; acute phase response factor; transcription factor; interleukin-6; signal transmission; liver; antibody; antisense; ribozyme; antiinflammatory; antitumor; hypotensive; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse signal transducer and activator of transcription (STAT) protein STAT4 (AAW03176) serves a dual purpose, i.e. signal transduction from ligand-activated receptor kinase complexes followed by nuclear translocation and DNA binding to activate transcription. Recombinant STAT4 can be obtd. using cDNA clone 198f6 (AAT31278) obtd. from splenic/thymic cells. STAT4 includes a DNA-binding domain (see also AAW03167) capable of both receptor recognition and message delivery via DNA binding in a receptor-ligand specific manner. STAT proteins and their DNA binding domains (see also AAW03165-75) are useful for screening antagonists used to inhibit STAT-mediated signal transduction and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        249 IACIGGPPNICLDRLENWITSLAESQLQTRQQIKKLEELQQKVSYKGDPIVQHRPMLEER 308

The present sequence represents a predominant allelic variant of human Signal Transducer and Activator of Transcription 3 (STAT3) protein, an intracellular transcription factor which mediates IL-6 signals. The encoding sequence differs from the original published human STAT3 gene sequence (Akira et al., 1994). Host cells comprising a recombinant STAT3 protein is useful as a medicament or pharmaceutical composition for treatment of autoimmune or inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  309 IVELFRNIMKSAFVVERQPCMPMHPDRPLVIKTGVQFTTKVRLLVKFPELNYQLKIKVCI 368

The present invention relates to a crystal of an N-terminal fragment of a signal transducer and activator of transcription (STAT) protein. The crystal effectively diffracts X-rays, allowing the determination of the atomic coordinates of the N-terminal domain to a resolution of greater than S.O Angstroms. The present sequence is the N-terminal domain of the murine STAT 3 protein. The N-terminal domain enables STAT dimers to interact and bind DNA cooperatively, a mechanism important for gene activation. The crystals are useful in drug screening and development by selecting a potential drug by performing rational drug design with the 3-dimensional structure determined for the crystal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New crystals of an N-terminal fragment of a signal transducer and activator of transcription that effectively diffracts x-rays, useful for drug screening and development.

The invention relates to methods for detecting compounds that bind to signal transducer and activator of transcription (STAT) proteins for the discovery and development of new drug compounds based on the structural properties of the protein crystal. The methods include: identifying a compound that binds to the N-terminal domain of a STAT protein, compound that binds to each other and/or their nucleic acid binding of the dimers to each other and/or their nucleic acid binding site; or identifying a compound that enhances or diminishes the ability of STAT protein dimers to induce the expression of a gene operably under the control of a promoter containing at least two adjacent weak binding sites for STAT protein dimers. The methods are used for identifying new drugs. An antagonist of STAT N-terminal dimeric interactions that control of a gene could be useful as drugs in the treatment of diseases, e.g. inflammation, allergy, asthma and leukaemias. On the other contains the useful as drugs in the treatment of diseases e.g. anaemia, thrombocytopaenia, cancer, obesity, viral diseases and conturpaenia, thrombocytopaenia, cancer, obesity, viral diseases and content of a procession. The present sequence is murine STAT3 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a complex of protein-protein interactions (forming a protein-protein interaction map, PIM) in adipocyte cells as defined in the specification, or polymucleotides in adipocytes encoding for the polypeptides. Also included are a recombinant cell expressing the interacting polypeptides and a method of selecting a modulating compound in adipocyte cells, by cultivating a recombinant host cell on a selective medium containing a modulating compound and a reporter gene the expression of which is toxic for the recombinant host cell which is transformed with two vectors, where the first vector comprises a polymucleotide encoding a second the second vector comprising a polymucleotide encoding a second hybrid polypeptide and an activating domain that activates the toxic reporter gene, when the first and second hybrid polypeptides interact and selecting the modulating compound which inhibits the growth of the recombinant host cell (i.e. using the yeast two-hybrid system). The complexes are useful for identifying compounds that modulate the protein-compound interactions and useful for treating obesity and metabolic disoaces are useful for desases. The interactions between the proteins of the compound isolated by the method is useful for treating and preventing obesity or metabolic diseases. The interactions between the proteins of

308 309 IVELFRNIAKSAFVVERQPCMPMHPDRPLVIKTGVQFTTKVRLLVKFPELNYQLKIKVCI 368 Sequence 3, Application US/09364970
Patent No. 6235873
GENERAL INFORMATION:
APPLICANT: Bromberg Jacqueline
TITLE OF INVENTION: CONSTITUTIVELY ACTIVE TRANSCRIPTION FACTORS AND THEIR
TITLE OF INVENTION: CONSTITUTIVELY ACTIVE TRANSCRIPTION FACTORS AND THEIR
TITLE OF INVENTION: USPENCIFFRATIVE CELLULAR CHANGES
TITLE OF INVENTION: DYSPROLIFFRATIVE CELLULAR CHANGES
CURRENT APPLICATION NUMBER: US/09/364,970
CURRENT FILING DATE: 1999-07-31
NUMBER OF SEQ ID NOS: 10
SOFTWARE: Patentin Ver. 2.0 US-09-364-970-5

Sequence 5, Application US/09364970

Sequence 5, Application US/09364970

GENERAL INFORMATION:

APPLICANT: Bromberg, Jacqueline

TITLE OF INVENTION: CONSTITUTIVELY ACTIVE TRANSCRIPTION FACTORS AND THEIR

TITLE OF INVENTION: USES FOR IDENTIFYING MODULATORS OF ACTIVITY INCLUDING

TITLE OF INVENTION: DYSPROLIFERATIVE CELLULAR CHANGES

TITLE OF INVENTION UNMBER: US/09/364,970

CURRENT PELLING DATE: 1999-07-31

NUMBER OF SEQ ID NOS: 10
